

The error "bad UNC" in your command suggests that the format of the UNC (Universal Naming Convention) path for the network share is incorrect. The correct format should include double slashes (//) before the server IP address or hostname, and a single slash (/) before the shared folder name.

Here's how to correct the command:

```
bash
Copy code
sudo mount -t cifs //192.168.80.11/SharedFiles /mnt/samba/sharedfiles -o
username=sambakali07,password=12345
```

## Explanation:

- `//192.168.80.11/SharedFiles`: This is the corrected UNC path.
- `/mnt/samba/sharedfiles`: The local directory where the network share will be mounted.
- `-o username=sambakali07,password=12345`: Specifies the username and password for the CIFS share.

## Example

To mount a CIFS share, you can use:

```
bash
Copy code
sudo mount -t cifs //192.168.80.11/SharedFiles /mnt/samba/sharedfiles -o
username=sambakali07,password=12345
```

If you need to provide more options, such as the domain, you can add them as follows:

```
bash
Copy code
sudo mount -t cifs //192.168.80.11/SharedFiles /mnt/samba/sharedfiles -o
username=sambakali07,password=12345,domain=MYDOMAIN
```

## Troubleshooting:

1. **Ensure the `cifs-utils` package is installed:**
  - If not installed, run: `sudo apt-get install cifs-utils`.
2. **Check if the server is reachable:**
  - Use `ping 192.168.80.11` to verify connectivity.
3. **Verify the shared folder name:**
  - Ensure that the share name `SharedFiles` is correct on the server.
